

# Liquefaction Susceptibility & Ice Cream Proximity in San Francisco

San Francisco's location is notoriously precarious for natural disasters - surrounded by water and fault lines much of the land is poised for liquefaction in the case of a large earthquake.

Liquefaction is a phenomenon where saturated sand and silt take on the characteristics of a liquid during the shaking of an earthquake.

During an earthquake San Francisco will likely lose power leaving ice cream shops with large amounts of goods that need to be consumed before they melt. Here you can see where to go to help the businesses based on the likelihood that the ice cream shop is still standing.

Note: this map lists out only the top ice cream stores based on the Infatuation's reviews - no need to waste time going to mediocre ice cream stores.
